Why is shift important?

Richard Jenkins, Senior Vice President, Arkema Coating Solutions: The need for sustainability impacts every aspect of our society. In the last decade, “climate change” or “circular economy” were not common terms. Now, they are in the news every day. The need to transform our society and adopt responsible lifestyle touches virtually every industry and every citizen in the world. We have to collectively adapt to this new paradigm by adopting a holistic approach including the social, environmental and economic dimensions.

Helene Pernot, Coating Solutions Sustainable Offer Manager: The coatings value chain – from the raw material through to the finished products – has to adapt to these new expectations. Everything we do has the potential to significantly change our world. How we design our products, what they are made from, how they are used and how they are able to be reused matters. Our expertise in materials science is continuously focused on developing solutions to meet the sustainability challenges faced by the markets and our customers.

How can we change?

Richard: We begin by listening to societal and market needs – and then adapt to an industry-wide way of thinking. Along with us, this includes customers, suppliers, regulators, employees, consumers and the financial community. Everyone in the value chain has to be working toward the same goal. That is how we begin to make a meaningful impact.

Helene: To change our impact on the world, we have to adapt the materials and processes we use. And, we need to do it together. A transformation is possible only if all industry players collaborate. We have to move as one toward safer solutions for people and the planet, lowering the carbon footprint across the value chain and enabling circular practices to preserve resources.

What are we doing to get there?

Richard: Arkema is committed on its whole supply chain to align with the 1.5°C trajectory set by the Paris Agreement on Greenhouse Gas (GHG) and to transition 65% of our sales to meet the UN Sustainable Development Goals (SDGs) by 2030. In the coatings industry, our teams are continuously focusing on three areas - designing and producing more sustainable performance materials; supporting the transition to more sustainable technologies (decarbonization, responsible manufacturing, etc.); and fostering the emergence of new markets driven by mega trends to enable the shift toward more sustainable uses, such as home efficiency, living comfort or electric mobility.

Helene: We have made tremendous progress in the past few years by eliminating hazardous air pollutants, transitioning to alternative feedstocks, reducing energy use across the value chain and making products that inherently contribute to sustainability in everyday life. Examples include materials that enable super-durable cool roof coatings, paint binders with up to 97% biorenewable content, low temperature curing resins and more. To accelerate the shift from fossil to renewable feedstocks and foster the reduction of CO2 emissions, we have started to certify our resins and additives plants to supply bio-attributed products using the mass balance approach according to the ISCC+ standard.

These are just a few examples of our current efforts. More importantly, however, are those yet to come as our journey is just starting. We will continue to work with partners throughout the coatings value chain to identify and enable new solutions that move us, the industry and the world toward a more sustainable future.

Richard Jenkins, Senior Vice President, Arkema Coating Solutions

Helene Pernot, Head of Sustainable Offer, Arkema Coating Solutions

Create high performing solutions to meet sustainability needs

Moving toward higher positive impact sustainable solutions

INTRODUCTION

The transformation of our offer is at the heart of our strategy and is driven by all levels of our organization. This is a new way of working in going beyond the traditional culture focused on quality & technical performances of products. All stakeholders of the ecosystem need to collaborate and be aligned on the challenges to solve. This requires, among others, a deep understanding of the end markets need, tools to assess the sustainable performance of our products, a ramp-up of knowledge on sustainability across the organization and a transparent communication on product environmental footprints.

Listen to the voice of customers & final market expectations

Assess our products and the impact of our actions

Communicate with transparency

Collaborate across the value chain to create solutions addressing market challenges

Raise knowledge across the organization

SAFETY

CLIMATE

CIRCULARITY

- Living comfort

Leveraging alternative feedstocks

More and more consumers are aware of the impact of their consumption on the planet. They have a clear willingness to adopt a more sustainable and responsible lifestyle through the consumption of products with a reduced impact on the environment. To meet these growing expectations, brand owners are moving away from fossil-derived materials toward materials coming from circular sources in order to preserve resources and reduce the impact on climate. The coatings sector is undergoing the same change and creating growth opportunities for bio-based coatings. To support this transition, we are engaged to accelerate the development of high performance resins and additives sourced from bio-based feedstocks by using the complementary approaches of physical segregation and mass balance.

BIO-BASED PAINT FOR INTERIOR WALLS

Challenge

In the rising demand for more sustainable products, consumers are not ready to compromise. One of the challenge of Brand owners is to develop bio-based paints with at least the same level of performance than fossil-based products. To contribute to this challenge, Arkema offers a full range of high-performance bio-based resins and additives. This use case illustrates that the combination of waterborne alkyd resin made from 97% biobased raw materials with a waterborne polyurethane thickeners enables formulators to create bio-based paints with a long lasting color strength.

MARKET EXPECTATIONS

- Lower impact on environment
- Long lasting color strength
- Safer
- Easy-to-clean

SYNAQUA[®]
BIO-BASED
Synaqua[®] 4856
Bio-based waterborne alkyd binder for high-performance sustainable coatings

COADIS
Coadis[™] 123 K et Coadis[™] 790
Hydrophobic dispersant for water resistance and color development

COAPUR[™]
BIO-BASED
Coapur[™] 3020 BB & Coapur[™] 817 BB
Bio-based waterborne liquid polyurethane thickeners for optimized rheology control

LOWER CARBON FOOTPRINT PAINT FOR INTERIOR AND EXTERIOR APPLICATIONS

Challenge

Developing bio-attributed materials using a mass balance approach is an alternative pathway to meet the challenge of combining performance, circular sourcing and lower carbon footprint. In this approach, bio-based and fossil raw materials are produced in the same existing assets while the quantity of bio-based raw materials is segregated by bookkeeping at each step of the value chain. The sourcing can be implemented in the short term as bio-attributed products are drop-in solutions enabling to keep the same level of high quality and performance without the need to requalify.

MARKET EXPECTATIONS

- Lower impact on environment
- Easy-to-use
- Exterior durability
- Easy-to-clean

COAPUR[™]
BIO-BASED
Coapur[™] 3020 BB & Coapur[™] 817 BB
Bio-based waterborne liquid polyurethane thickeners for optimized rheology control

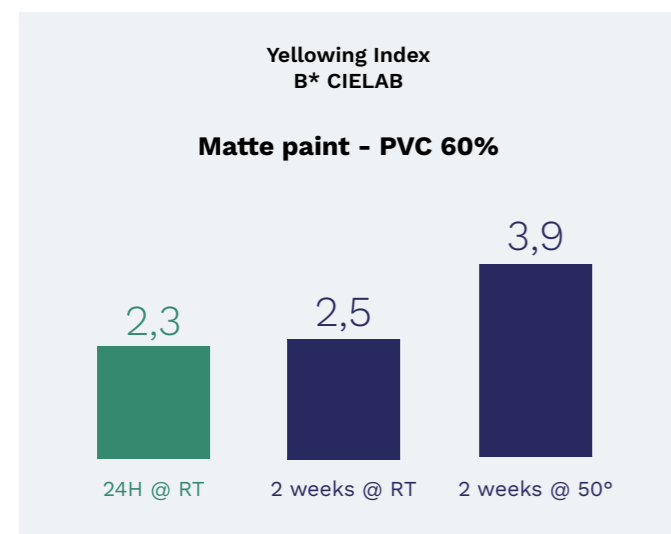

ENCOR[®]
Encor[®] 2787 MB
Bio-attributed waterborne acrylic binder for high-performance sustainable coating

ECODIS[™]
BIO-BASED
Ecodis[™] P 50 MB
Bio-attributed dispersing agent to improve stability and pigment dispersion

Technical performance

→ Low yellowing

Sustainable performance

→ **Synaqua[®] 4856**

is a waterborne alkyd resin made from **97% bio-based** raw materials coming from byproducts of predominately Nordic foresting, it is APEO, ammonia, solvent and plasticizer free including low emissions suitable for many ecolabel paint formulations.

97%
bio-based

→ APEO free, low VOC & SVOC

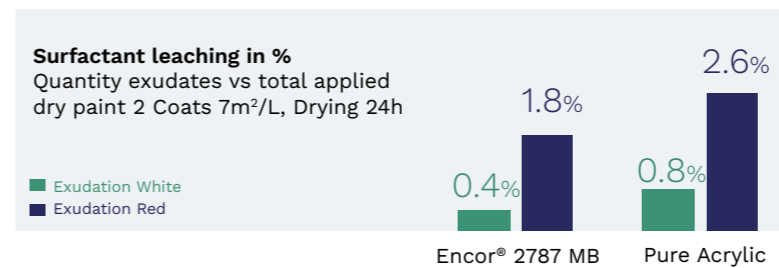

→ **Coapur[™] 3020 BB and Coapur[™] 817 BB**

are polyurethane thickeners made from **90 & 93%** bio-based raw materials to improve antissettling, leveling and application properties of the paint.

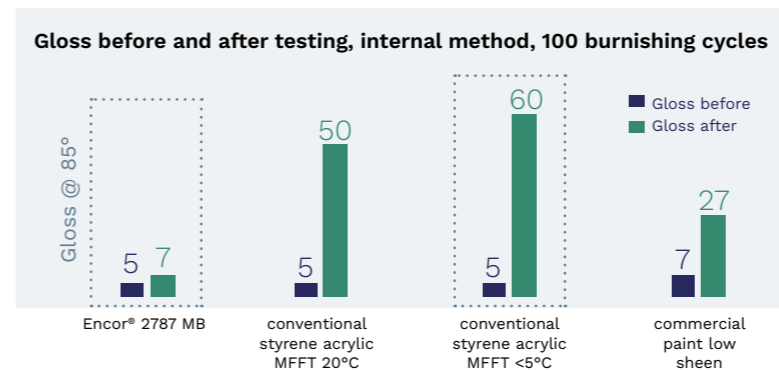

90 and 93%
bio-based

Technical performance

→ Excellent surfactant leaching resistance

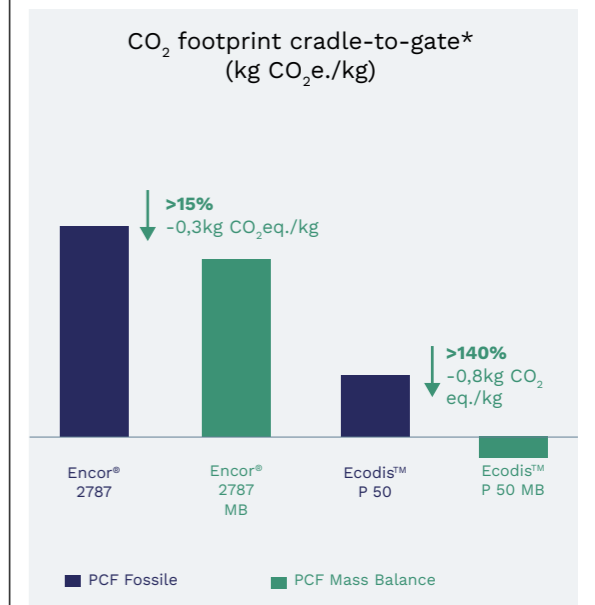

→ Improved gloss resistance (interior)

Sustainable performance

→ Lower CO₂ footprint versus fossil grade

* PCF cradle to gate including biogenic carbon uptake

Transitioning to lower energy consumption technologies

Rising and volatile energy costs, tightening emission regulations and an overall drive for environmentally conscious manufacturing practices have led many finishing professionals to look for alternative curing technologies. If the application phase is key to take full advantage of coating technical performances, it also impacts the turnover and productivity of companies. We offer a wide range of materials suitable for almost all the curing technologies of the market and help our customers to transition to lower energy consumption technologies.

UV/EB CURED COATINGS FOR COIL

Challenge

The benefits of precoated metal span from aesthetic advantages to economic efficiencies, making it the substrate of choice in a wide pallet of construction areas. To decarbonize the industry, coil coating players position the UV/EB coating technology as a game changer. According to the European Coil Coating Association (ECCA), the UV/EB curing technology has the potential to reduce energy use by at least 60% versus conventional technologies. As a pioneer in energy curing systems, Arkema supports this transition with a full range of high performing solutions suited to UV/EB coating technologies.

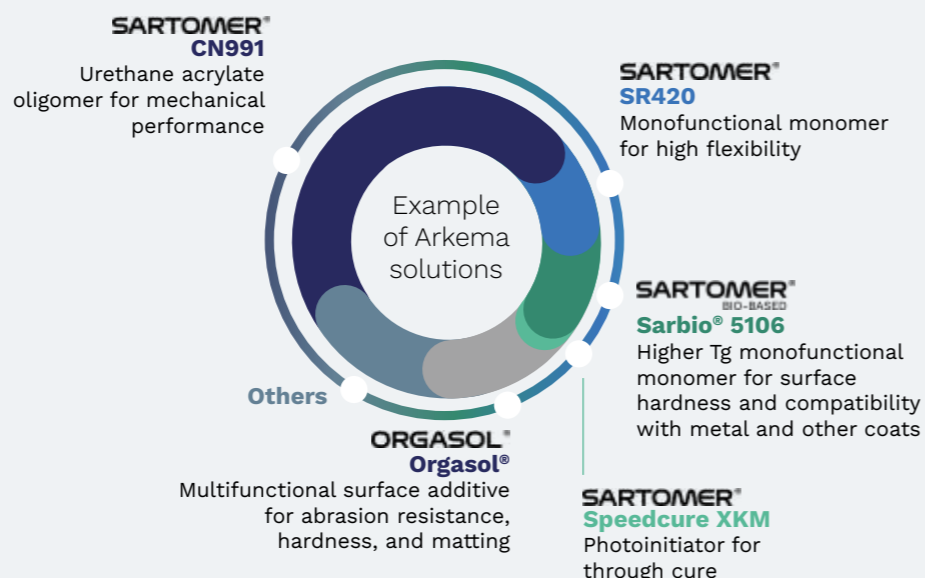

POWDER COATINGS TO PROTECT MDF & WOOD SUBSTRATES

Challenge

Across stakeholders of the coating industry, powder resin technology is recognized as an advanced technology in terms of durability, flexibility and robustness as well as sustainability as it enables the removal of VOC and the reduction of waste during application. There is a growing demand to expand the performance of powder technologies to low curing temperature to support the decarbonization of the industry and to enable the expansion to a vast array of non-traditional substrates such a medium density fiber boards (MDF). In this use case, we will illustrate how the Arkema low curing temperature powder resins portfolio drives the creation of innovative MDF coatings.

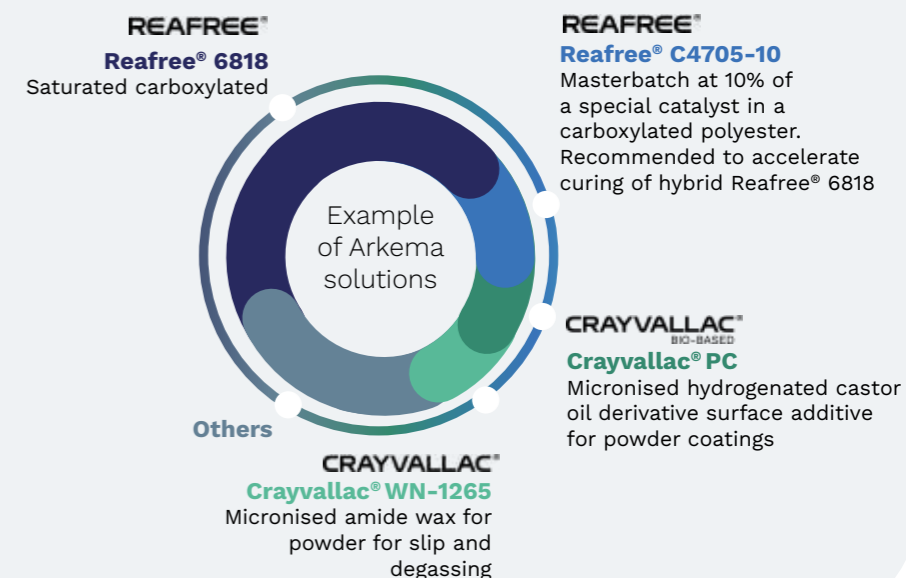

MARKET EXPECTATIONS

- Lower impact on environment
- Higher throughput process
- Aesthetic & Functional Properties

MARKET EXPECTATIONS

- Unconventional colours and effects
- Resistance
- Expand the use of powder to non-metal substrates
- Safer

Technical performance

100%
active content

2X surface coverage
per kilogram of paint compared to conventional systems

High coating performance

Sustainable performance

→ **At least 60% of energy savings**
(ECCA - Zero Carbon Coil Coating Line - The Way Forward)

no extraction of solvents
+
no incineration
+
ambient temperature cure

→ **Reduced material use**
as extended surface coverage

Technical performance

→ **Exceptional design flexibility to meet unconventional colours and effects**

Sustainable performance

- **Very low curing temperature at 135°C** = **extended use of powder coating to MDF and wood substrate**
- **1 layer using powder versus several with liquid** = **Reduce material use**
- **Less energy to cure vs liquid solutions** = **Reduced energy consumption**
- **No VOC**

Making safer products

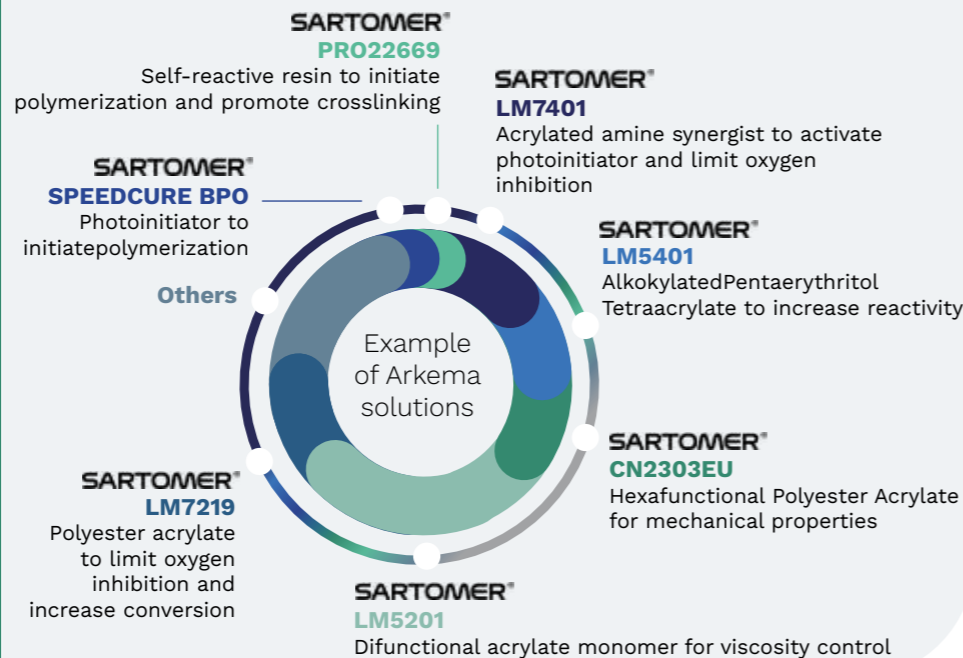

Among consumer expectations for a more sustainable lifestyle, Health & Well being is one of the first concerns. More and more digital applications scoring safety profile of consumer goods are developed to guide consumers toward informed choices. For the coatings & ink materials, the elimination of substance of concern and hazardous air pollutants has been a long term trend which led to the conversion from solvent borne formulations to low VOC formulation such as waterborne, UV/EB and powder resins. Arkema has a pro-active approach to assess health, safety and environmental impacts of our products in order to anticipate future regulations and market trends. This approach leads us to propose a selection of profile products offering safety profile to further protect consumers, workers and community.

INK FOR INDIRECT FOOD PACKAGING

Challenge

Consumers now place significantly more value on food safety and health. Designing food packagings with safety in mind is crucial. Printing inks and varnishes applied on packaging make no exception and have to combine high safety profile with high resistance during usage lifetime. Arkema is continuously innovating in this field to extend its product offer of low migration solutions for indirect food packaging. The latest grades include products combining multifunctionality, high molecular weight, and high reactivity under low energy curing LED systems.

MARKET EXPECTATIONS

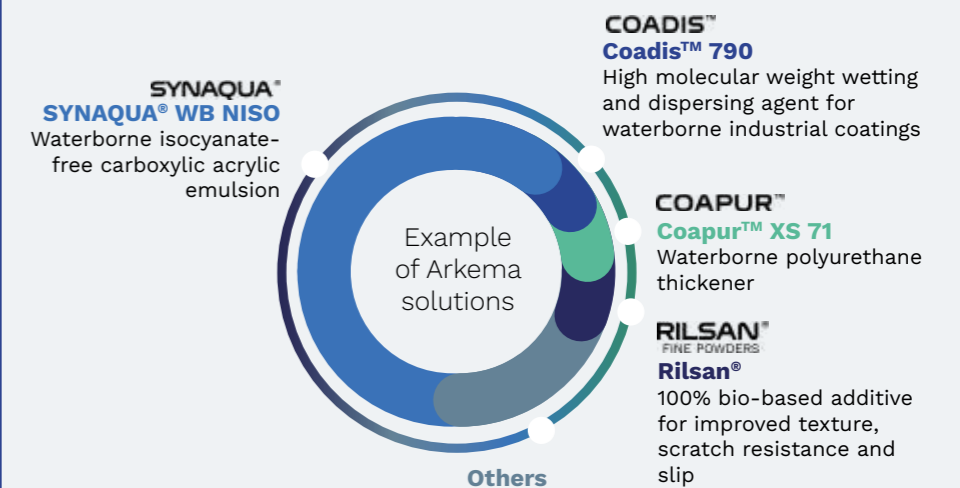

IMPROVE HEALTH AND SAFETY OF PAINT APPLICATOR

Challenge

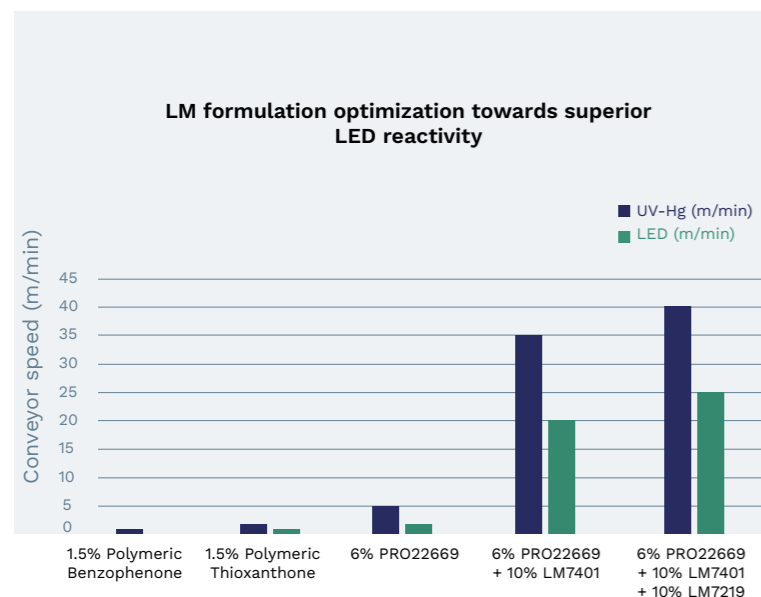

From decades, the coatings value chain has strived to achieve better performances while reducing substance of concern and hazardous air pollutants levels. Thanks to its complete portfolio of technologies including, high solid, waterborne, UV and powder, Arkema is definitely focused on the development of safer solutions with lower volatile organic compounds. In order to move one step further and anticipate future regulations, Arkema is continually exploring innovative solutions to improve the protection of consumers and the working conditions of paint applicators. This use case introduces a waterborne isocyanate-free system offering similar performance to a standard 2 pack polyurethane system with significantly lower VOC.

MARKET EXPECTATIONS

Technical performance

→ Better reactivity under LED

Sustainable performance

→ Reduced migration risk under LED
No migration by set off and no migration through the packaging

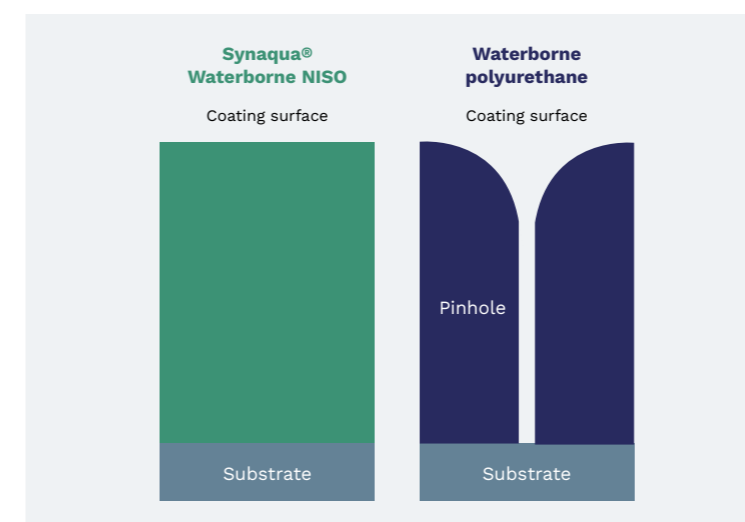

Better compromise with no Thioxanthone migration and low extractible acrylates

Technical performance

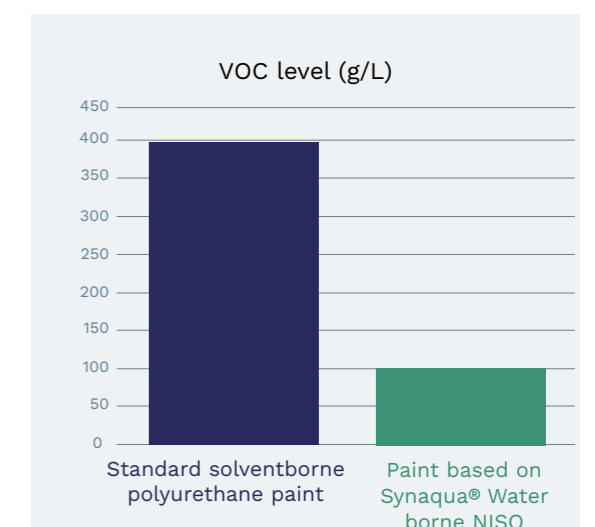

→ Similar performance to a standard 2 pack polyurethane system

50% dry film thickness increase without pinholes vs. waterborne polyurethane

Sustainable performance

→ Waterborne formulation with low VOC
Isocyanate-free to protect paint applicators

Foster the emergence of new markets

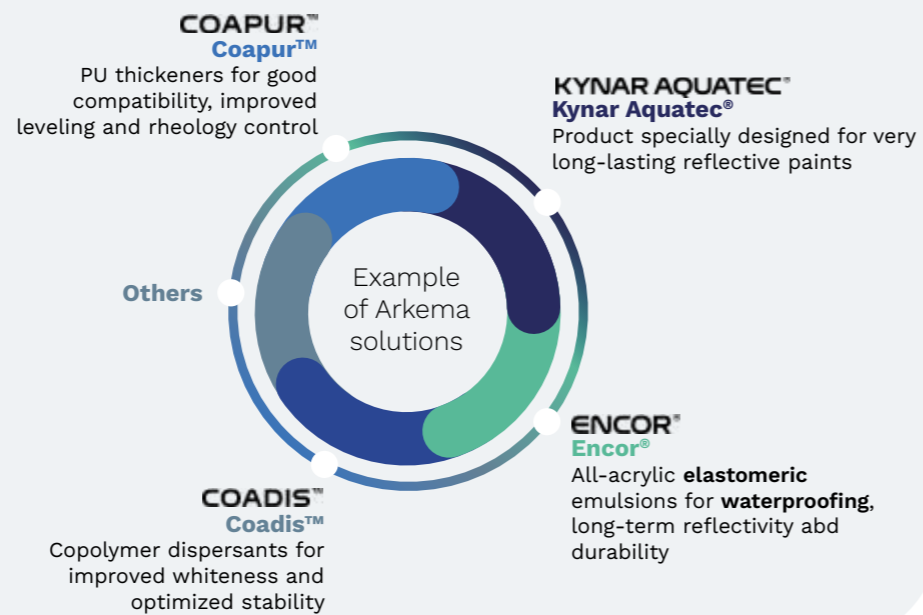

Focus on Mass Balance approach

REDUCING ENERGY CONSUMPTION OF BUILDINGS

Challenge

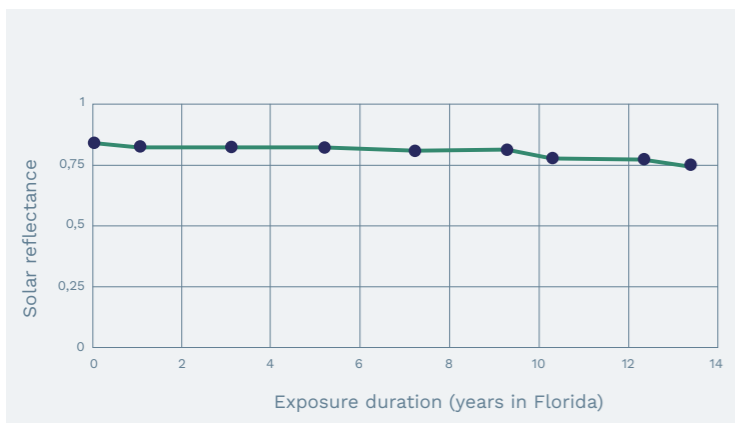

With global warming, cool roofing is emerging as an efficient and economical solution for lowering building temperatures and costs for air conditioning. The idea is simple: a white roof coating that reflects the sun's rays during periods with lots of sunlight. Many building roofs can be converted into cool roofing. From primer, to top coat, going through base coat, Arkema offers a complementary range of products tailored to cool roof constraints.

MARKET EXPECTATIONS

Technical performance

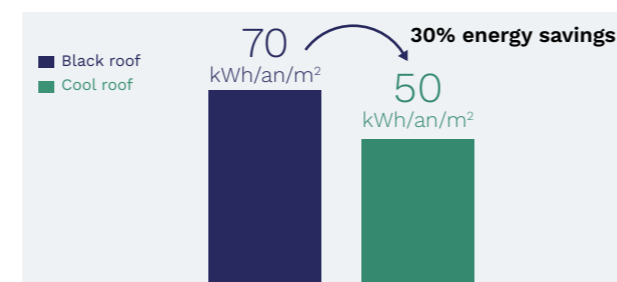

→ **Very high level of reflectivity throughout coating lifetime**

Sustainable performance

→ **Impressive energy savings**

→ **30% of energy saved**

→ **Reduce air conditioning costs by 30%**

→ **Improve indoor thermal comfort up to 6°C**

The transition from virgin fossil to renewable feedstocks, either bio-based or recycled, is a key priority to reduce GHG emissions and move to a more circular economy. There are several ways to implement this transition. It can be done either through a segregated approach or through a system of mass balance attribution. The choice to use a segregated or mass balance approach depends on several dimensions such as the availability of raw materials or the size and investments needed to build dedicated plants all along the value chain. Arkema is developing both approaches to accelerate the transition and innovation into renewable materials.

What is a segregated production ?

A segregated production is a production in which the bio-based materials are processed in segregated production lines. In this configuration, bio-based content can be measured by C14 analysis in final products.

What is the mass balance approach?

The mass balance approach consists in replacing fossil by renewable feedstocks at the origin of the supply chain, processing both feedstocks in the same production assets. The quantity of renewable material is segregated by bookkeeping to attribute this quantity to finished products at the end of the chain. The Mass Balance approach requires no modification to the process, or new product accreditation as the high quality and performance of the products remain the same, which makes it easier for our customers to adopt them.

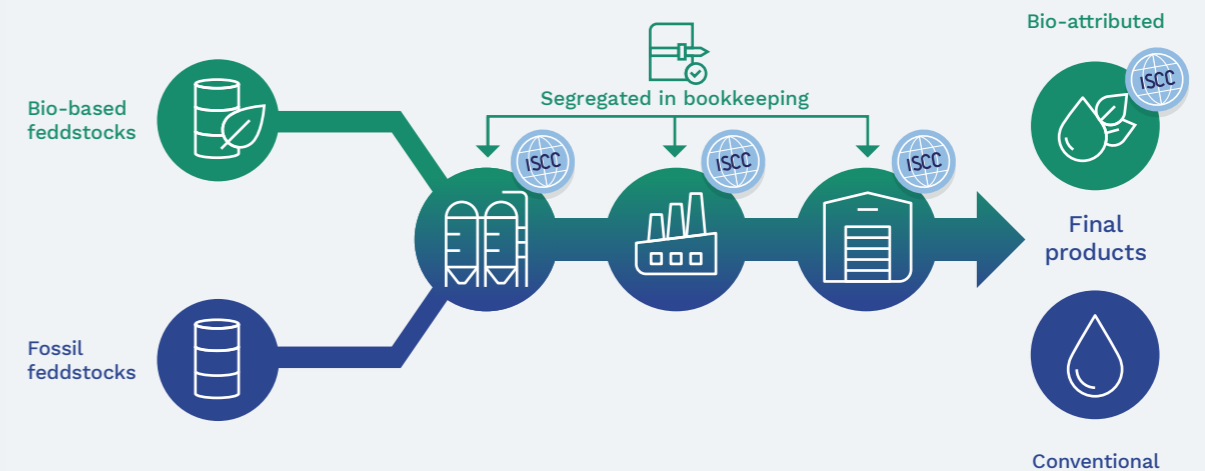

Certifying the traceability of this bio-based origin

To ensure the traceability of our Mass Balance products, our entire supply chain is certified by a third party according to the ISCC+ standards. We provide our customers with certificates that guarantee the share of bio-based feedstock in the product they are purchasing. The ISCC+ certification of the whole supply chain guarantees that the origin of the renewable sources meets standards for sustainable feedstocks.

How does Mass Balance complement segregated approach?

Arkema is implementing both segregated and mass balance sourcing to accelerate the innovation into renewable materials.

Mass balance approach principle

CN9210	Aliphatic Urethane Acrylate	6	1,90 @ 60°C	0,25	NA	1930	3	25	120	Improved cure response under LED, most suitable for EB curing Non Intentionally Added Tin Superior weathering performance	3D printing, Composites, Flexographic & screen inks, Overprint varnishes, Plastic coatings
CN9276	Aliphatic Urethane Acrylate	6	6	0,4	NA	1700	1	14	90	Non Intentionally Added Tin Superior weathering performance	Inkjet, screen & Offset inks, Overprint varnishes, Plastic & wood coatings
CN9301B80	Aliphatic Urethane Acrylate diluted with 20% of HDDA	3	3,4	0,1	NA	874	3,5	21,6	63	Most suitable for EB curing Superior weathering performance	Plastic coatings Wood coatings
CN981	Aliphatic Urethane Acrylate	2	8,9 @60°C	0,2	NA	920	75	25	35	Most suitable for EB curing Superior weathering performance	3D printing, Adhesives & sealants, Composites, Flexographic & screen inks, Overprint varnishes, Plastic coatings
CN991	Aliphatic Urethane Acrylate	2	9,7	30 Pt/Co	NA	10	15	1,5	15	Most suitable for EB curing Superior weathering performance	3D printing, Flexographic, Inkjet & screen inks, Overprint varnishes, Plastic coatings

PHOTOINITIATOR

Product	Chemistry	CAS number	Type	Absorption maxima (nm)	Form	Performance	Sustainable attribute	Markets
Speedcure 7010	Polymeric Thioxanthone	1003567-83-6	Norrish Type II	257, 312, 383	Solid	Depth Cure LED Low Odor Pigmented systems	 Improved cure response under LED  Reduced risk of migration	Flexographic, Offset & Screen inks Industrial coatings

RHEOLOGY MODIFIERS

Product	Chemistry	Bio content	Key benefits	Sustainable attribute	Markets
Crayvallac® ANTISETTLE CVP	Castor Derivative powder	100%	Ease of activation	 Bio-based	Industrial coatings Graphic arts Adhesives
Crayvallac® MT	Castor Derivative powder	99%	Ease of activation	 Bio-based	Industrial coatings Graphic arts Adhesives
Crayvallac® SUPER	Polyamide Wax powder	93%	High Efficiency	 Bio-based	Industrial coatings Graphic arts Adhesives

MULTIFUNCTIONAL ADDITIVE

Product	Chemistry	Av particle size µm	Bio content	Melting point °C	Sustainable attribute	Market
Rilsan® D	polyamide powders	from 20 to 100	100%	190	 Bio-based from renewable castor plant Lower carbon footprint (biomethane gas use for production)	Metal coating

Siège social : Arkema France

420 rue d'Estienne d'Orves
92705 Colombes Cedex
France
T +33 (0)1 49 00 80 80

Coating Solutions – 03-2023 – Design : hippie.
